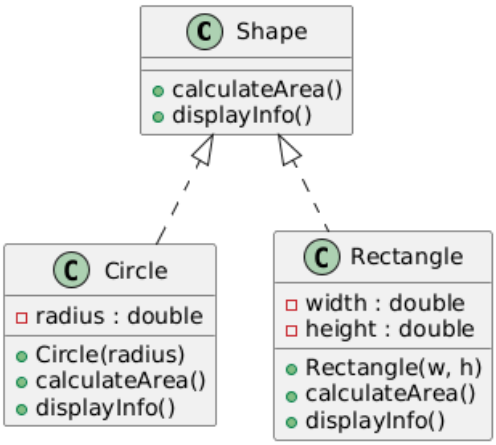
Lab 06

Task 01: based on class diagram, create a small system for shapes. Each shape must be able to compute its area.

In a `Main` class:

- create at least one `Circle` and one `Rectangle`
- store them in an array of type `Shape[]`
- loop through the array and call `displayInfo()` for each object

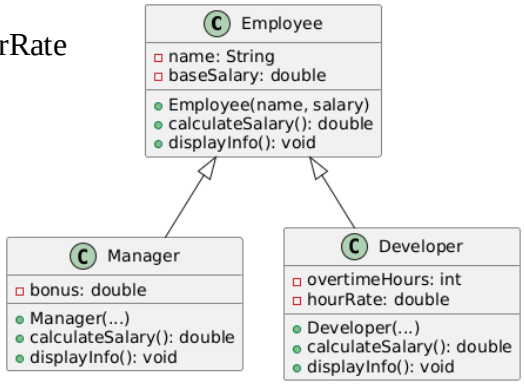


Task 02: Create a utility class for simple mathematical operations. The same method name will be used with different parameter lists.

- Create a class called `Calculator`.
- Overload the method `add()` with the following versions:
  - `int add(int a, int b)`
  - `double add(double a, double b)`
  - `int add(int a, int b, int c)`
- Overload the method `multiply()` with:
  - `int multiply(int a, int b)`
  - `double multiply(double a, double b)`
- In a `Main` class: test all overloaded methods, display the returned results

```java
Calculator calc = new Calculator();
System.out.println(calc.add(2, 3));
System.out.println(calc.add(2.5, 4.1));
System.out.println(calc.add(1, 2, 3));
System.out.println(calc.multiply(4, 5));
System.out.println(calc.multiply(2.5, 3.0));
```

Task 03: Based on class diagram, create a simple employee management model where different employee types calculate salary differently.

Override `calculateSalary()` in both subclasses:
- for `Manager`: salary = base salary + bonus
- for `Developer`: salary = base salary + overtimeHours × hourRate


Override `displayInfo()` if needed.
In a `Main` class:
- create objects of each type
- store them in an `Employee[]`
- print their final salaries
